CARDIOHEALTH STATION SCAN SAMPLE REPORT

CardioHealth® Report

Name : JOE
Date of Birth : 05/10/1952
Age : 58

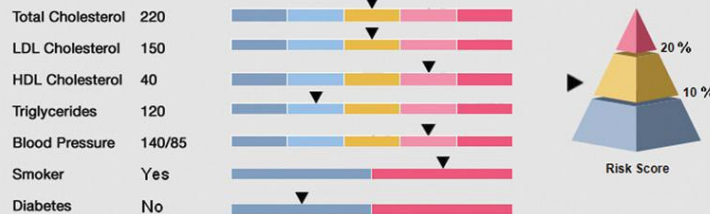

Exam Date : 04/04/2011
Physician : DR. PETER SMITH

Traditional risk factors were assessed to determine your Framingham Risk Score.

To help further define your risk of a future cardiovascular event, an ultrasound imaging study of the carotid arteries on both sides of your neck was performed. The thickness of the inner two layers (the intima and media) of your carotid artery wall was measured.

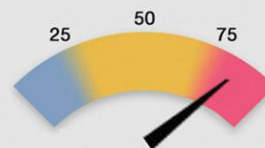

Thickening of the artery wall is the earliest pathological evidence of atherosclerosis (formation of fatty streaks and plaques in the arteries). Your study also included an assessment for any significant blockage in the carotid arteries.

Traditional Risk Factor Assessment

Framingham Risk Score: Your 10-year risk of having a heart attack is estimated to be 12%.

Direct Arterial Evaluation

Carotid IMT Percentile

Carotid Ultrasound Summary

Mean Carotid IMT (artery wall thickness) in the Right Common Carotid Artery was 0.850 mm.

Your Carotid IMT value is in the top 25th percentile for people of your age, gender, and ethnicity. The higher the percentile, the higher the risk.

Plaque was seen in the right carotid artery.

Right	Left
MEAN IMT 0.850mm (>75 th tile)	MEAN IMT 0.550mm (25-50 th tile)
Plaque PRESENT	Plaque ABSENT

DISCLAIMER: These images are only for illustration purposes; see actual images on following pages

- Snapshot of cardiovascular risk profile, including traditional risk factors and results of carotid ultrasound imaging study
- Developed by key opinion leaders in preventive cardiology and imaging of subclinical atherosclerosis
- Designed to be easily understood and presented to the patient
- Combination of schematic and actual ultrasound images to depict wall thickness and arterial plaque may help to increase patient compliance with treatment
- Full color graphics

(The actual report comes in multiple pages.)
